Add WeChat powcoder

Intended Learning Outcomes

- Understand the goal of visible surface determination
- Describe the method of back-face detection
- Describe the method of Z-buffer method
- Describe the method of ray casting
- Able to program visible surface determination techniques

Visible Surface Detection

- Also called Hidden Surface Elimination
- Only visible surfaces should be rasterized
- The problem is not easy as has to handle partially visible scenarios –
 - Concave objects
 - one object partially in front of each other

Three Methods

- Back-face detection (also called Culling)
- Z buffer (also called depth buffer)
- Ray Casting

Assignment Project Exam Help

<https://powcoder.com>

- Back-face detection is always run as a preliminary test. It is fast and reduces about half of the workload before further processing.
- Other methods also exist: e.g. painter's algorithm, A buffer method, ...

Back-Face Detection / Culling

- Fast and simple
- Use as a preliminary step before more sophisticated visibility tests
- Eliminates $\approx 50\%$ of faces from further consideration

$\mathbf{N} \cdot \mathbf{V} < 0 \Rightarrow$ back face

\Rightarrow eliminate

- Sometimes, \mathbf{v} is replaced by the **VPN** for faster approximate processing
- Disadvantage: cannot handle concave object or partially overlapping object

Z Buffer

- Also called depth buffer method
- Two buffers
 - ❑ Z/Depth buffer : store depth values for each (x, y) position
 - ❑ *Frame / Refresh* buffer : store colour values for each (x,y) position
- Buffer stores the current visible surface information, values are updated as soon as new visible information found

Z buffer algorithm

Three surfaces overlapping pixel position (x, y) on the view plane. The visible surface, S_1 , has the smallest depth value.

Algorithm

1. Initialize the depth buffer and frame buffer so that for all buffer positions (x, y)

$\text{depthBuff}(x, y) = 1.0, \quad \text{frameBuff}(x, y) = \text{backgndColor}$

2. Process each polygon in a scene, one at a time.
 - a. for each projected (x, y) pixel position of a polygon, calculate the depth z (if not already known).
 - b. If $z < \text{depthBuff}(x, y)$, compute the surface colour at that position and set

$\text{depthBuff}(x, y) = z, \quad \text{frameBuff}(x, y) = \text{surfColor}(x, y)$

After all surfaces have been processed, the depth buffer contains depth values for the visible surfaces and the frame buffer contains the corresponding colour values for those surfaces.

Ray Casting

- retrace the light paths of the rays that arrive at the pixel
- for each pixel, send a ray from FRP that goes through the pixel
- find all intersections of the ray with the surfaces
- the nearest intersection is the visible part of the surface for that pixel

Add WeChat powcoder

A diagram illustrating the ray casting process. A blue dot on a black-outlined rectangle represents a pixel position. A dashed red line connects this dot to a blue pyramid in a 3D scene. A solid red line with an arrow continues from the pyramid, passing through a blue cube and another pyramid, representing the ray's path through the scene.

Add WeChat powcoder

Ray casting

A ray along the line of sight from a pixel position through a scene.

Comparison of Z buffer and Ray Casting

Method	Good for situations
Z buffer	Objects that cannot be adequately described by simple equations
Ray casting	Objects that can easily be described by simple equations

OpenGL Functions

- Back face removal

```
glEnable (GL_CULL_FACE);
```

```
glCullFace (GL_BACK);
```

Assignment Project Exam Help

- Z Buffer

<https://powcoder.com>

```
glutInitDisplayMode (GLUT_DOUBLE | GLUT_RGB |  
GLUT_DEPTH);
```

Add WeChat powcoder

```
glClear (GL_DEPTH_BUFFER_BIT);
```

```
glEnable (GL_DEPTH_TEST);
```
